Press release:

Domain-Parking without redirect and with own outbound links

Genoa, January 12, 2008 - As the first and only provider in the world, the Italian company ADEGRO (www.adegro.com) offers a domain parking without a redirect of any kind by the beginning of this year. The parked domains physically reside on the owner's server, showing up with a freely defined website name and an individual claim. ADEGRO's topics portals showing contents and ads, are included invisibly. Domains participating in ADEGRO's parking program, may also display own outbound links, contact data and about-us pages defined freely by the domain owners themselves.

Traditional domain-parking: Often loss of PR and search engines position

For quite a long time, SEO experts talk about some serious disadvantages of traditional domain-parking programs: The visitors of those parked domains are mostly redirected to a standard advertising page by a DNS or server redirect. This method mostly leads to a complete

bounce by the search engines. Also for the Pagerank, Google's powerful indicator of a website's relevance, the traditional domain-parking is purely toxic: The domain often loses its Pagerank completely within a short time period.

ADEGRO's solution allows keeping domain values

The Italian provider's domain-parking that will be interesting especially for domain traders who have to keep the domains' values while parking them, is completely different. The webmaster just puts a small set of ADEGRO's domain files on the domain, the rest is done by ADEGRO's inclusion technology. After a couple of minutes, an ADEGRO topic portal that the webmaster has defined before, shows up on the "parked" domain. The clue: The inclusion is absolutely invisible as it's done on the server side. The result: From the visitor's and the search engines' point of view, the domain is a real worthwhile domain carrying contents, links, contact data etc. So the domain keeps its position in the search engines and its Pagerank. And even more: As reported by domain owners using ADEGRO's technology, some domains have even enhanced their search engines position and their Pagerank while being parked.

Own outbound links

ADEGRO's innovative concept offers some amazing new perspectives for many professionals in the SEO and SEM line: It's possible to show own outbound links on parked domains. This certainly has been completely impossible at traditional domain-parking programs. As professionals know, outbound links are of vital importance for the linkbuilding of brands, campaigns and websites in general and above all for the Pagerank inheritance. Due to the embedding of outbound links on parked domains, domain owners and traders now gain the opportunity to have an efficient link marketing done with parked domains as well for the first time.

High quality individual content

The success that ADEGRO has had so far, is not only based on their inclusion technology. Another very important factor is the content showing up on ADEGRO's portals that, according to ADEGRO, is of a pretty high quality. It is not enough, say the ADEGRO makers, to offer web pages that mainly consist of advertisements and standardized phrases. Google and the other search engines watch out carefully, what is content and what is advertising and they also keep an eye on the content quality. For these reasons, ADEGRO produces enormous amounts of content that is individually written by professional authors and saved to ADEGRO's databases. Using an elaborated selection system, each new parking domain is then filled with individual content on its creation.

Diversity of categories, languages and layouts

To make sure that neither the owners nor the visitors of the portals get bored, ADEGRO offers its topics portals in a large diversity of categories, languages, layouts etc. ADEGRO portals are available in 12 categories, 4 languages (English, German, Italian, French) and more than 100 layout/style combinations. Portal users may define all these criteria in their administration menu with some quick mouse clicks.
